

Rialto Energy

Rialto Energy is pushing ahead with its Gazelle field development offshore Ivory Coast and has started a drill stem test on the Gazelle-P3 ST2 well.

The testing program involves perforating of the Upper Cenomanian (UC-1) oil reservoir zones then sequentially perforating and commingling the gas and condensate portion of the UC-1 reservoir.

The program is expected to take two weeks, with the well then to be suspended for future completion as a Gazelle field production well.

Rialto will then move to begin preparations to drill the Gazelle-P4 production well.
