

Rialto Energy

Rialto Energy has announced the completion of a block-wide, full-fold 3D seismic survey covering 891sq.km, offshore Ivory Coast.

Processing and interpretation of the data will allow Rialto to map the exploration potential within Block CI-202, through better definition of leads which have already been identified.

The block contains four significant under-appraised oil and gas discoveries which are located in water depths of between 50-100m.
